# *Acknowledgements*

To my friends *I Cazzilli*: Fede, Lorenz, Grismina and Ste, for always being worthy of being the family I chose for myself and for looking out for me day after day.

To Emme, for showing me what true compassion is and inspiring me to be a better version of myself everyday.

To Carol, the closest tea-brewing sister I could hope for. I'm truly proud of you.

To my Mom, for teaching me, among another thousand things, her own personal special way of calling somewhere "*home*".

To my Dad, for always trying to be the man he ought to be.

To the rest of my strange, enlarged family, for always supporting me in every possible way.

To Luca, my tireless desk-mate and friend, who never called himself out of an all-nighter and who always speaks a word of kindness or dedication in times of need.

To Valentina, who helped me stand in times when I couldn't stand for myself.

To Matteo, an amazing companion in this journey through pediatrics, data sets and enthusiastic English-vocabulary show off.

To dott. Monasta, for making sense of numbers that didn't seem to have any.

To prof. Barbi and prof. Ventura, for remembering me that medicine can be how i dreamed it.

And lastly, to myself, for always believing that, even when your heart's lost all its hope, after dawn there will be sunshine.

# Chapter 1

## Introduction

Children's health has historically always been a sensitive and concerning matter for human kind. We can find reason for this in our universal instinctive draw towards the protection and care for our offspring, and in how children can be struck by some of the most devastating and life-wrecking diseases. Sometimes, these are the phenotypical expression of genetical marks, scarred onto and into these kids. Despite the origin, the color of the skin or the culture the child bears in his lineage, human beings feel the need to raise and safeguard them from all harms, on a physical, emotional and spiritual level. This is one of the strongest biological calls to action.

Thus, pediatrics must care and remember that children's health and well-being must be guarded across political borders, across poverty, across starvation. This thesis, and the paper it's so deeply bound to, set themselves to renew this vow.

### 1.1 Intercountry and international adoptees

International adoptees are children with special needs: compared to 19% of the general population, approximately 39% of adopted children require special health-care attention (as extensively explained in [1]). They are of school age, part of a sibling group, members of historically oppressed racial or ethnic groups, or they

have considerable physical, emotional, or developmental need: all potential elements of vulnerability endangering the child's healthy upbringing. This is not a limited problem: annually more than 30.000 kids are adopted across countries, and, in the United States, of all 136.000 national adoptees in 2008, almost 25% come from foreign countries; U.S. families adopted 22.884 children in 2004, mostly from China (which accounts for 33% alone), Ehtiopia, Russia and South Korea (see [1]), 8.868 more in 2012 and 4.714 in 2017 (see [3]). Further data on annual U.S. international adoptions and their social and financial costs can be found at [5].

Although personal experiences obviously vary, most children placed for international adoption have some history of poverty and social hardship in their home countries, and approximately 65% are adopted from orphanage or institutional settings. As explained in [1], the effects of institutionalization and other early life stresses impact all areas of early growth and development. As a result, many children require specialized support and understanding to overcome such impacts and to reach their full potential.

Moreover, as in [2], internationally adopted children may withstand a number of juridical and social impairments even after adoption. No generalization can be made on this matter though, since laws and policies greatly differing among countries. They may be stripped of their name (a.e. in Cape Verde, Argentina and Turkey), have no right to inheritance (a.e. in Republic of Moldova and France), see the termination of the relationship with birth parents and relatives (a.e. in Japan, Albania and Togolese Republic), loose their citizenship and not acquire a new one (a.e. Hungary and New Zealand), or even bear limitations on marriage in their adult life (a.e. in Argentina and France). These boundaries are to be considered associated to the emotional and psychological stress of new surroundings, new affections, new habits, and even new climatic environments (which can be clinically relevant, as explained in 1.3.0.2).

All these elements account for some of the factors that contribute to the hardships an adoptee must endure throughout his life and call for a strong action from pediatric physicians and social services employees, as possible support figures which may change these kids' lives forever.

1.1.1 Levels and trends in intercountry adoption worldwide

The United Nations Population Division estimates that about 40.000 intercountry adoptions took place each year around 2005, accounting for 15% of the total number of adoptions (see [2]). As shown in Table 1.1 and 1.2, the involved countries, both for destination and origin, are relatively few.

Rank	Receiving country <sup>1</sup>	Number	Percentage	Main country of origin
1	United States of America	19.056	15	China
2	France	3.995	90	Haiti
3	Spain	3.951	82	Russia
4	Italy	2.177	68	Russia
5	Germany	1.919	34	Russia
6	Canada	1.875	46	China
7	Sweden	1.093	65	China
8	Netherlands	1.069	78	China
9	Denmark	688	55	China
10	Norway	664	76	China
11	Switzerland	558	79	Colombia
Median		370	64	

TABLE 1.1: Countries of destination with the largest number of intercountry adoption

Source: United Nations Population Division report (see [2])

Here I can talk of the country of origin.

As show in Table 1.4, write stuff.

Most of these adoptions occur in a few countries. The United States, with over 127,000 adoptions in 2001, accounts for nearly half of all adoptions. Large numbers of adoptions also take place in China (almost 46,000 in 2001) and the Russian Federation (more than 23,000 in 2001). Other countries with sizeable numbers of adoptions are Germany, Ukraine and the United Kingdom, each with over 5,000 adoptions annually. Brazil, Canada, France and Spain also record significant numbers, ranging from 4,000 to 5,000 adoptions per year[2]. The remaining adoptions

<sup>1</sup>Only countries with more than 500 adoptees per year were included. For the complete table, please see the referenced source.

Rank	Receiving country <sup>1</sup>	Number	Percentage	Main receiving country
1	China	8.644	19	United States
2	Russia	5.777	25	United States
3	Guatemala	3.726	97	United States
4	Ukraine	2.672	35	United States
5	Korea	2.258	58	United States
6	Vietnam	1.419	49	United States
7	India	1.098	36	United States
8	Bulgaria	1.010	44	<b>Italy</b>
9	Kazakhstan	948	26	United States
10	Colombia	846	60	France
11	Ethiopia	810	93	France
Median		50	34

*Source: United Nations Population Division report (see [2])*

are distributed among a large number of countries. In 48 of the 118 countries having data on the total number of adoptions, between 100 and 1,000 adoptions occur annually. In another 40 countries, fewer than 100 adoptions take place each year. These countries include Mozambique and Sudan, both of which have large child populations, with at least ten million children each (United Nations, 2005)[2].

Although international adoption is increasingly considered a measure of last resort if the child's birth family or community are unable or unwilling to care for him anymore (see [1]), the number of international adoption has steadily been rising in

the last couple years, as stated in ... . NOT REALLY

### 1.1.2 International adoptions in Italy

Being a rather open-ended project, i.e. a project in which there is no strict and well-defined set of software requirement specifications, the objectives of the development have been purposefully kept wide and general, as to reflect the idea that the project could follow an exploratory approach.

Nonetheless, there are still some guidelines that have been followed from the beginning to the end of the project:

- The project shall result in a working prototype of a Virtual Reality application.
- The application shall allow the handling of CFD data; in particular, it shall provide:
  - visualization of the data,
  - interaction with the data,
  - some basic forms of manipulation of the data.
- The application shall allow the import of data from ParaView.
- The application shall run compatibly at least on Windows (version 7 or greater), and optionally on Linux.
- The application shall support a HTC Vive kit.
- The code should be designed to be maintainable, flexible and expandable.
- The application should be easy to use, being it aimed at CFD scientists with little to no prior VR experience.

## Discussion

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Pellentesque nibh metus, suscipit a scelerisque sit amet, rhoncus et lectus. Mauris eget erat rutrum, euismod massa id, maximus mauris. Nulla maximus, ex sit amet lacinia consequat, enim ante mollis dui, sit amet tincidunt massa felis id magna. Aenean gravida ante nec volutpat rutrum. Cras eget ullamcorper leo. Curabitur eu volutpat tellus. Integer nec ornare sapien. Fusce ipsum justo, interdum quis libero a, mattis tristique velit. Phasellus rhoncus lorem non ultrices luctus.

### 4.1 Objectives achieved

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Pellentesque nibh metus, suscipit a scelerisque sit amet, rhoncus et lectus. Mauris eget erat rutrum, euismod massa id, maximus mauris. Nulla maximus, ex sit amet lacinia consequat, enim ante mollis dui, sit amet tincidunt massa felis id magna. Aenean gravida ante nec volutpat rutrum. Cras eget ullamcorper leo. Curabitur eu volutpat tellus. Integer nec ornare sapien. Fusce ipsum justo, interdum quis libero a, mattis tristique velit. Phasellus rhoncus lorem non ultrices luctus.

## 4.2 Our recommendations

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Pellentesque nibh metus, suscipit a scelerisque sit amet, rhoncus et lectus. Mauris eget erat rutrum, euismod massa id, maximus mauris. Nulla maximus, ex sit amet lacinia consequat, enim ante mollis dui, sit amet tincidunt massa felis id magna. Aenean gravida ante nec volutpat rutrum. Cras eget ullamcorper leo. Curabitur eu volutpat tellus. Integer nec ornare sapien. Fusce ipsum justo, interdum quis libero a, mattis tristique velit. Phasellus rhoncus lorem non ultrices luctus.

## 4.3 Future work

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Pellentesque nibh metus, suscipit a scelerisque sit amet, rhoncus et lectus. Mauris eget erat rutrum, euismod massa id, maximus mauris. Nulla maximus, ex sit amet lacinia consequat, enim ante mollis dui, sit amet tincidunt massa felis id magna. Aenean gravida ante nec volutpat rutrum. Cras eget ullamcorper leo. Curabitur eu volutpat tellus. Integer nec ornare sapien. Fusce ipsum justo, interdum quis libero a, mattis tristique velit. Phasellus rhoncus lorem non ultrices luctus.

# Chapter 5

## How to Do

This is all I know on LaTeX up to now.

### 5.1 Including Sections and Subsections

This is my first section.

#### 5.1.1 I like myself

I'm nice.

#### 5.1.2 but I'm weird

but fun.

##### 5.1.2.1 LOST OF FUN!

Writing writing and writing.

### 5.1.2.2 I'm calm and shit

I write stuff in subsubsections.

**And lastly this is new and amazing PARAGRAPH:** You can write whatever you want and it's pretty cool and new. I still like subsubsections more.

## 5.2 Including references and citations

This is pretty simple to cite: developed as open-source C++ software by Rudolf Biczok [8]. We'll learn more about this as we go. Let's see if they change order [6]. They should've change [7].

### 5.2.1 Referencing images and tables!

So you can see figure 5.1 at page 23. AMAZING  
OR you can also see the table 5.1 at page 23!

### 5.2.2 Referencing chapters and subchapters

You can also ref chapters, as Chapter Results 3.

### 5.2.3 Using footnotes

Let's try this out.<sup>1</sup> And another one to see if it is progressive and shit.<sup>2</sup>

---

<sup>1</sup>This is my first footnote.

<sup>2</sup>CAREFUL! Don't leave any spaces before the command or they will be rendered.

I'll try now to “place them manually”. This is were the sign is.<sup>3</sup>  
Somewhere else in the text. I insert what it contains.

## 5.3 Including quotes

This is how a quote looks.

From an evolutionary perspective, virtual reality is seen as a way to overcome limitations of standard human-computer interfaces; from a revolutionary perspective, virtual reality technology opens the door to new types of applications that exploit the possibilities offered by presence simulation.

And also in text quotes: “[by] immersing the user in the solution, virtual reality reveals the spatially complex structures in computational science in a way that makes them easy to understand and study”.

And dots...

## 5.4 Including URLs

We can include `https://github.com/vrcranfield/UnityApplication`.

## 5.5 Including code

The following code is written by Lorenzo:

---

<sup>3</sup>This is my footnote!

```
=IF(
  OR(
    E68 = "Russia";
    E68 = "Albania";
    E68 = "Bulgaria";
    E68 = "Ungheria";
    E68 = "Ucraina";
    E68 = "Moldavia";
    E68 = "Romania"
  );
  "Europa dell'Est";
  IF(
    OR(
      E68 = "Burkina Faso";
      E68 = "Etiopia";
      E68 = "Costa d'Avorio";
      E68 = "Congo";
      E68 = "Guinea Bissau";
      E68 = "Africa";
      E68 = "Ghana";
      E68 = "Benin"
    );
    "Africa";
    IF(
      OR(
        E68 = "Colombia";
        E68 = "Brasile";
        E68 = "Guatemala";
        E68 = "Peru";
        E68 = "Costa Rica"
      );
      "America del Sud";
      IF(
        OR(
          E68 = "Armenia";
          E68 = "India";
          E68 = "Cina";
          E68 = "Vietnam";
          E68 = "Sri Lanka";
          E68 = "Siberia";
          E68 = "Nepal";
          E68 = "Filippine"
        );
        "Asia";
        ""
      )
    )
  )
)
```

## 5.6 Formatting Text

This is **BOLD** *This is ITALIC* This is SANS SERIF This is TRUE TYPE

In this sentence THIS IS TINY. THIS WHOLE SENCE IS TINY.

I go back to normal.

Then I can go for large, or Large, or Larger, or Huge and even HUGE.

## 5.7 Including bulleted list

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Nam quam tellus, venenatis a consectetur non, pretium ac nunc. Nullam eu tellus sed augue laoreet scelerisque.

- The first item of your list
- The second item of your list
- The third item of your list

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Nam quam tellus, venenatis a consectetur non, pretium ac nunc. Nullam eu tellus sed augue laoreet scelerisque. Curabitur efficitur, dolor ut pretium fermentum, nisi enim pulvinar nunc, non bibendum urna odio nec neque. Cras tellus turpis, posuere in dictum vitae, vestibulum quis velit.

1. The first item of your list
2. The second item of your list
3. The third item of your list

Lorem ipsum dolor sit amet, consectetur adipiscing elit. Nam quam tellus, venenatis a consectetur non, pretium ac nunc. Nullam eu tellus sed augue laoreet scelerisque. Curabitur efficitur, dolor ut pretium fermentum, nisi enim pulvinar nunc, non bibendum urna odio nec neque. Cras tellus turpis, posuere in dictum vitae, vestibulum quis velit.

- a) The first item of your list
- b) The second item of your list
- c) The third item of your list

## 5.8 Including Figures

Orci varius natoque penatibus et magnis dis parturient montes, nascetur ridiculus mus. Nam vulputate finibus malesuada. Praesent at egestas turpis. Vivamus vitae tellus malesuada, laoreet ex ac, venenatis est. Aliquam dictum tincidunt libero, cursus posuere arcu sodales non. In sed metus sit amet arcu vestibulum mollis ut vel nibh. Nam non velit tortor. Integer ac sapien a purus porta convallis. In vestibulum aliquam nunc vitae faucibus. Etiam tristique iaculis orci, vel aliquam felis accumsan et. Nulla ultricies, nisl eu malesuada lobortis, ante metus faucibus libero, vitae blandit odio enim sit amet tortor.

## 5.9 Including Tables

# Appendix A

## Data set elaboration: VBA expressions

This appendix provides all the code used in this thesis to elaborate the data set. Visual Basic for Application (VBA) is the programming language chosen for this purpose, as the most effective and manageable way of elaborating data in excel sheets. Further information can be found throughout this thesis, especially in Section 2.2 at page 10.

In the following appendix, cells are indicated as combination of a letter (identifying the column) and a number (identifying the line), as they originally were in the database. Every line represents a single child's evaluation; every column represents one of the examined parameters. The full column-parameter correspondence can be found in following Table A.1.

Column	Parameter	Unit of measure (or cell content type)	Description
<i>A</i>	First and last name	<i>text</i>	The name of
<i>B</i>	Sex	<i>text</i>	The sex of th
<i>C</i>	Age (in months)	months	The age of th

---

<sup>2</sup>Although registering the name of the patient posed a risk in terms of possible privacy breach, it was added nonetheless to easily identify each patient as the data set got larger through the years.

D	Age (in years)	years	*. For further
E	Nation of origin	text	*.
F	Geographic area of origin	text	*.

TABLE A.2: Column-parameter correspondence

### A.1 Age (in months)

This VBA expression checks the *Age (in months)* column (C) and, if it's not empty, it divides it's value by 12, rounding it down, just as age works. The `ROUNDOWN` function was implemented in order to avoid overestimating child's age.

```
=IF(  
  C2 <> "" ;  
  ROUNDDOWN(  
    C2 / 12;  
    0  
  );  
  ""  
)
```

### A.2 Geographic area of origin

To further understand how geographic origin influenced the results of our screening program, every nation was grouped up in 4 major continents or areas with the following excel expression.

```
=IF(  
  OR(  

```

```
E2 = "Russia";
E2 = "Albania";
E2 = "Bulgaria";
E2 = "Hungary";
E2 = "Ukraine";
E2 = "Moldavia";
E2 = "Romania"
);
"Eastern Europe";
IF(
  OR(
    E2 = "Burkina Faso";
    E2 = "Ethiopia";
    E2 = "Ivory Coast";
    E2 = "Congo";
    E2 = "Guinea Bissau";
    E2 = "Africa";
    E2 = "Ghana";
    E2 = "Benin"
  );
  "Africa";
  IF(
    OR(
      E2 = "Colombia";
      E2 = "Brazil";
      E2 = "Guatemala";
      E2 = "Peru";
      E2 = "Costa Rica"
    );
    "South America";
    IF(
      OR(
        E2 = "Armenia";
        E2 = "India";
        E2 = "China";
        E2 = "Vietnam";
        E2 = "Sri Lanka";
        E2 = "Siberia";
        E2 = "Nepal";
        E2 = "Philippines"
      );
      "Asia";
      ""
    )
  )
)
```

## A.3 Pathological values

The data set contained numerical values for many laboratory analyses. Cut-off values for these results were established via the most recent literature review, as explained in Section 2.2.2. In the following sections, the code used to establish which ones were pathological and which were not, is displayed and shortly explained.

### A.3.1 Weight and height

These parameters, since they had already been converted to percentile values, were easily implemented with the following simple VBA expression:

```
=IF(  
  H2 <> "";  
  IF(  
    H2 <= 10;  
    1;  
    0  
  );  
  ""  
)
```

### A.3.2 Haemoglobin

Hemoglobin required a more complicated and sophisticated expression, in order to be stratified, because hemoglobin pathological cut-offs depend on various factors, as described in Section 2.2.2.1. Moreover mild, moderate and severe anemias had to be separated in order to properly evaluate the child's health status; each one had an arbitrary value of 1 (*mild*), 2 (*moderate*) or 3 (*severe*) associated to it.

```
=IF(  
  L2 <> "";  
  IF(  

```

```
AND (
    C2 >= 6;
    C2 < 60
);
IF (
    L2 >= 11;
    0;
    IF (
        AND (
            L2 < 11;
            L2 >= 10
        );
        1;
        IF (
            AND (
                L2 < 10;
                L2 >= 7
            );
            2;
            3
        )
    )
);
IF (
    AND (
        C2 >= 60;
        C2 < 132
    );
    IF (
        L2 >= 11,5;
        0;
        IF (
            AND (
                L2 < 11,5;
                L2 >= 11
            );
            1;
            IF (
                AND (
                    L2 < 11;
                    L2 >= 8
                );
                2;
                3
            )
        )
    )
);
IF (
    AND (
```

```

        C2 >= 132;
        C2 < 168
    );
    IF(
        L2 >= 12;
        0;
        IF(
            AND(
                L2 < 12;
                L2 >= 11
            );
            1;
            IF(
                AND(
                    L2 < 11;
                    L2 >= 8
                );
                2;
                3
            )
        )
    )
)
);
""
)

```

### A.3.3 MCV

As just described for haemoglobin, MCV required more complicated techniques in order to be stratified, because of its variability (through age, sex, ecc...), as described in Section 2.2.2.2. Moreover, boolean results couldn't be accepted for this parameter, so arbitrary values were used to appropriately identify microcytic (1) and macrocytic (2) anemias.

```

=IF(
    N2 <> "";
    IF(
        B2 = "F";
        IF(
            AND(

```

```
        C2 >= 0;
        C2 < 60
    );
    IF(
        N2 > 85;
        2;
        IF(
            AND(
                N2 <= 85;
                N2 >= 69
            );
            0;
            1
        )
    );
    IF(
        AND(
            C2 >= 60;
            C2 < 120
        );
        IF(
            N2 > 89;
            2;
            IF(
                AND(
                    N2 <= 89;
                    N2 >= 75
                );
                0;
                1
            )
        );
        IF(
            AND(
                C2 >= 120;
                C2 < 168
            );
            IF(
                N2 > 92;
                2;
                IF(
                    AND(
                        N2 <= 92;
                        N2 >= 78
                    );
                    0;
                    1
                )
            )
        )
    )
```

```
)  
)  
);  
IF(  
    B2 = "M";  
    IF(  
        AND(  
            C2 >= 0;  
            C2 < 60  
        );  
        IF(  
            N2 > 85;  
            2;  
            IF(  
                AND(  
                    N2 <= 85;  
                    N2 >= 71  
                );  
                0;  
                1  
            )  
        );  
        IF(  
            AND(  
                C2 >= 60;  
                C2 < 120  
            );  
            IF(  
                N2 > 88;  
                2;  
                IF(  
                    AND(  
                        N2 <= 88;  
                        N2 >= 76  
                    );  
                    0;  
                    1  
                )  
            );  
            IF(  
                AND(  
                    C2 >= 120;  
                    C2 < 168  
                );  
                IF(  
                    N2 > 90;  
                    2;  
                    IF(  
                        AND(  

```

```
        N2 <= 90;  
        N2 >= 76  
    );  
    0;  
    1  
    )  
    )  
    )  
    )  
    );  
    ""  
    )  
    );  
    ""  
    )
```

### A.3.4 Circulating iron

The following VBA expression was used to establish whether circulating iron levels were insufficient.

```
=IF(  
    P2 <> "";  
    IF(  
        AND(  
            P2 >= 16;  
            P2 <= 129  
        );  
        0;  
        1  
    );  
    ""  
)
```

### A.3.5 Ferritin

The following VBA expression was used to identify pathological ferritin values. These were, again, stratified for *mild* (1), *moderate* (2) and *severe* (3) deficiencies.

```
=IF(  
  R2 <> " ";  
  IF(  
    R2 >= 20;  
    0;  
    IF(  
      AND(  
        R2 < 20;  
        R2 >= 15  
      );  
      1;  
      IF(  
        AND(  
          R2 < 15;  
          R2 >= 10  
        );  
        2;  
        IF(  
          R2 < 10;

### A.3.6 Vitamin D

The following VBA expression was used to establish whether Vitamin D (serum 25-hydroxycholecalciferol) values were *insufficient* (1), *deficient* (2) or *severely deficient* (3). The predictive choice for this marker is explained at Section 2.2.2.4.

```
=IF(  

```

```
AA2 <> "";  
IF(  
    AA2 >= 50;  
    0;  
    IF(  
        AND(  
            AA2 < 50;  
            AA2 >= 25  
        );  
        1;  
        IF(  
            AND(  
                AA2 < 25;  
                AA2 >= 10  
            );  
            2;  
            IF(  
                AA2 < 10;  
                3  
            )  
        )  
    )  
);  
""  
)
```

Column	Parameter	Unit of measure (or cell content type)	Description
A	First and last name	<i>text</i>	The name of the kid. <sup>1</sup>
B	Sex	<i>text</i>	The sex of the kid.
C	Age (in months)	months	The age of the kid.
D	Age (in years)	years	*. For further information, see Section A.1.
E	Nation of origin	<i>text</i>	*.
F	Geographic area of origin	<i>text</i>	*.
G	Residency time in Italy (in months)	months	*.
H	Weight	percentile	*.
I	Pathological weight	<i>boolean</i>	*.
J	Height	percentile	*.
K	Pathological height	<i>boolean</i>	*.
L	Haemoglobin	g/dl	*.
M	Pathological haemoglobin	<i>boolean</i>	*.
N	MCV	fl	*.
O	Pathological MCV	<i>boolean</i>	*.
P	Circulating iron	µg/dl	*.
Q	Pathological circulating iron	<i>boolean</i>	*.
R	Ferritin	ng/ml	*.
S	Pathological ferritin	<i>boolean</i>	*.

TABLE A.1: Column-parameter correspondence
